LIST OF APPENDICES

Appendix A 4M Project Monitor Well Chronology

1.0 INTRODUCTION

This report summarizes Colorado Oil and Gas Conservation Commission (COGCC) 4M Project monitoring well program activities and well pressure monitoring data through January 1, 2011 for Archuleta and La Plata Counties. Monitoring work was performed by COGCC staff and Norwest Corporation on behalf of the COGCC. Activities completed during this reporting period included installation of one new monitoring well in Archuleta County, wellhead pressure transducer cable gland seal replacement, automated well pressure monitoring and data transmission to In-Situ® Data Center, online data retrieval, data analysis, and summary report preparation. Well pressure measurements recorded by data loggers in each monitoring well are available to all interested parties upon request.

The COGCC 4M Project monitoring well program includes 17 wells at 11 monitoring well sites. Figure 1-1 (following page) shows the location and name of all eleven monitoring well sites and individual site monitoring well names in accordance with the following well nomenclature.

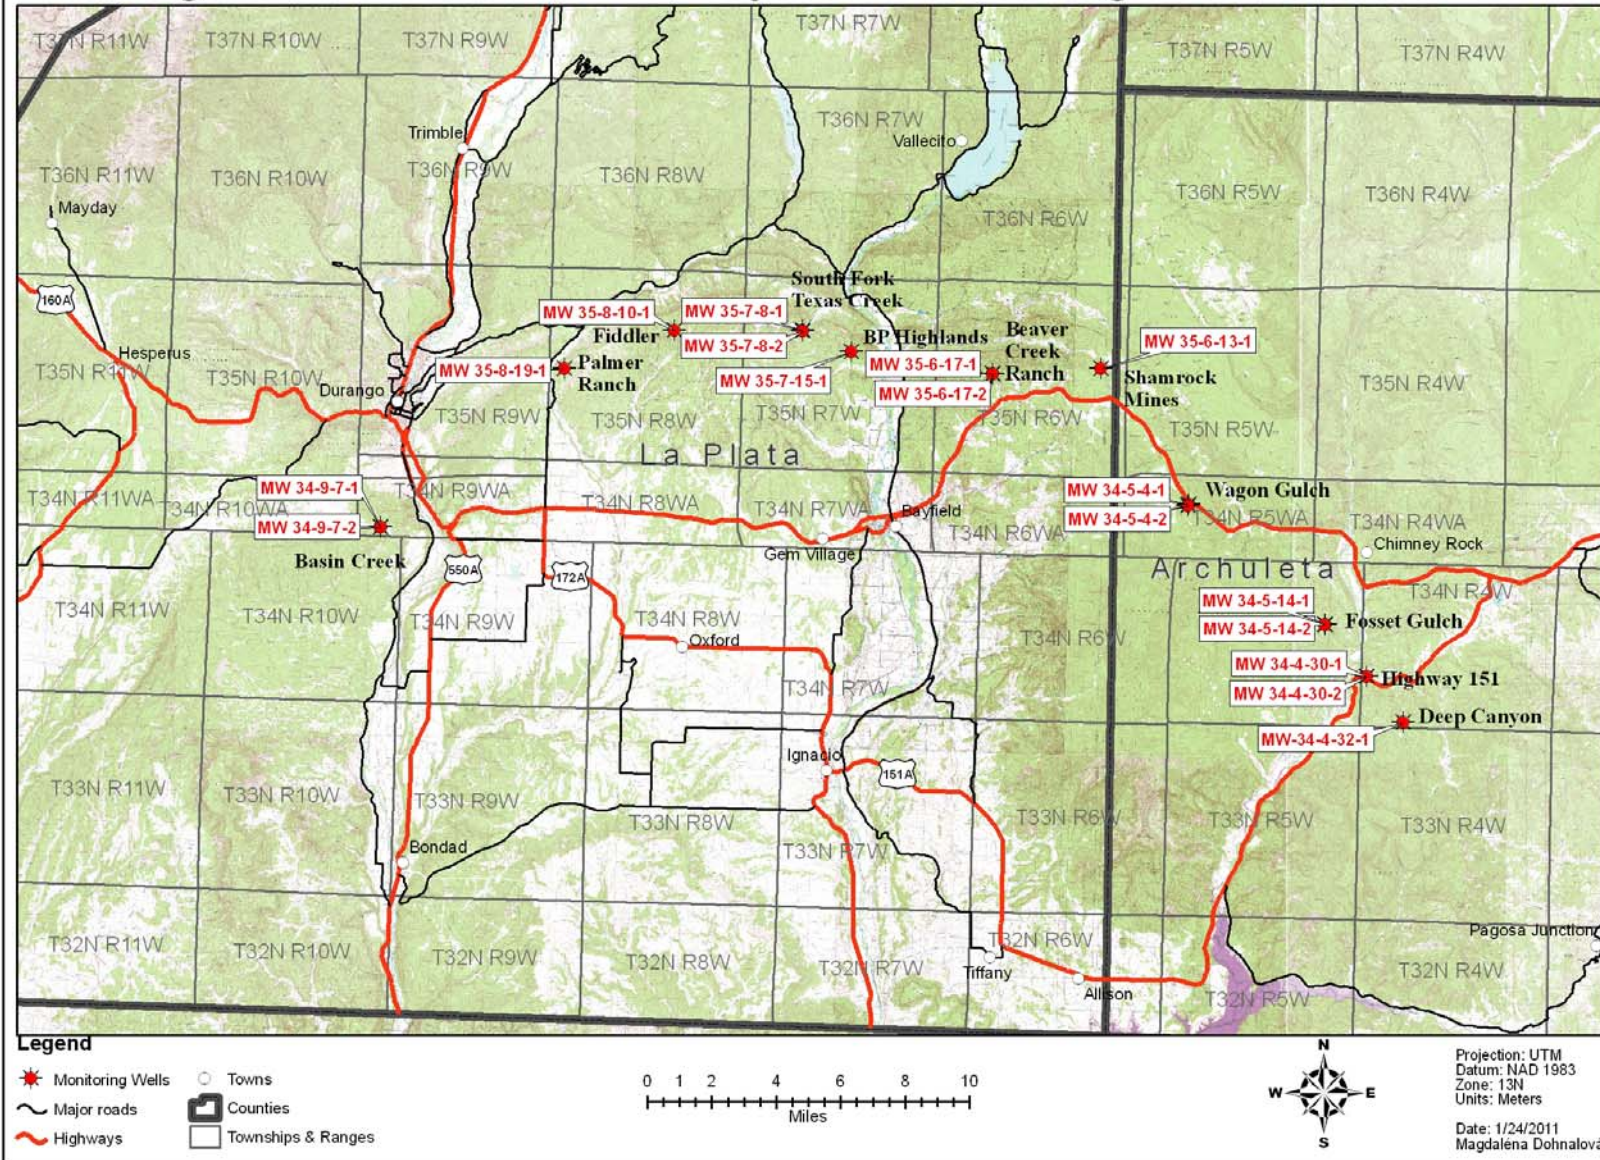

Table 1-1 lists the 4M project monitoring sites and wells by county, project phase and initiation date.

**Table 1-1
4M Project Monitoring Well Program Phases**

County	Site Name	Well Name	Project/Phase	Phase Initiation Date
Archuleta	Wagon Gulch	MW 34-5-4-1 MW 34-5-4-2	4M/Archuleta	October 2008
	Fosset Gulch	MW 34-5-14-1 MW 34-5-14-2		
	Highway 151	MW 34-4-30-1 MW 34-4-30-2		
	Deep Canyon	MW 34-4-32-1		June 2010
La Plata	Basin Creek	MW 34-9-7-1 MW 34-9-7-2	3M/La Plata	January 2001
	S. Fork Texas Creek	MW 35-7-8-1 MW 35-7-8-2

2.0 LA PLATA COUNTY MONITORING WELL DATA SUMMARY

Well pressure was measured and recorded twice daily (12-hour interval) for the 7 monitoring well sites located in La Plata County, Colorado. Applicable well pressure and calculated water level data for the entire period of record for each monitoring well are plotted in annotated charts. The water level in a well is calculated using the depth of the lower transducer and the difference in pressure between upper and lower transducers. This calculation is applicable at sites where the water level in a well is above the lower pressure transducer and below the upper pressure transducer.

2.1 BASIN CREEK

Monitor well MW 34-9-7-1 has been monitored since November 29, 2001 and monitor well MW 34-9-7-2 has been monitored since May 24, 2002. Initial and ending monitoring well pressures and calculated water levels in the wells for each period of record are summarized in Table 2-1. All Level Troll cable wellhead Conax gland seal fitting Teflon sealants were replaced with cold temperature resistant Neoprene sealants on August 18, 2010.

Table 2-1
Well Pressure Data Summary for Basin Creek Monitoring Wells

Well ID and Transducers	Period of Record	Initial Shut In Well Pressure psia	Ending Shut In Well Pressure psia	Net Change in Well Pressure psi	Initial Water Level in Well fbg	Ending Water Level in Well fbg	Net Change in Water Level ft
MW 34-9-7-1 Upper	11/29/01 to 1/1/11	11.46	28.82	17.36	20.97	155.92	-134.95
Lower		249.34	208.23	-41.11			
MW 34-9-7-2 Upper	5/24/02 to 1/1/11	33.26	15.51	-17.75	Upper transducer is under water at 5 ft below ground level		
Lower		241.42	220.86	-20.56			

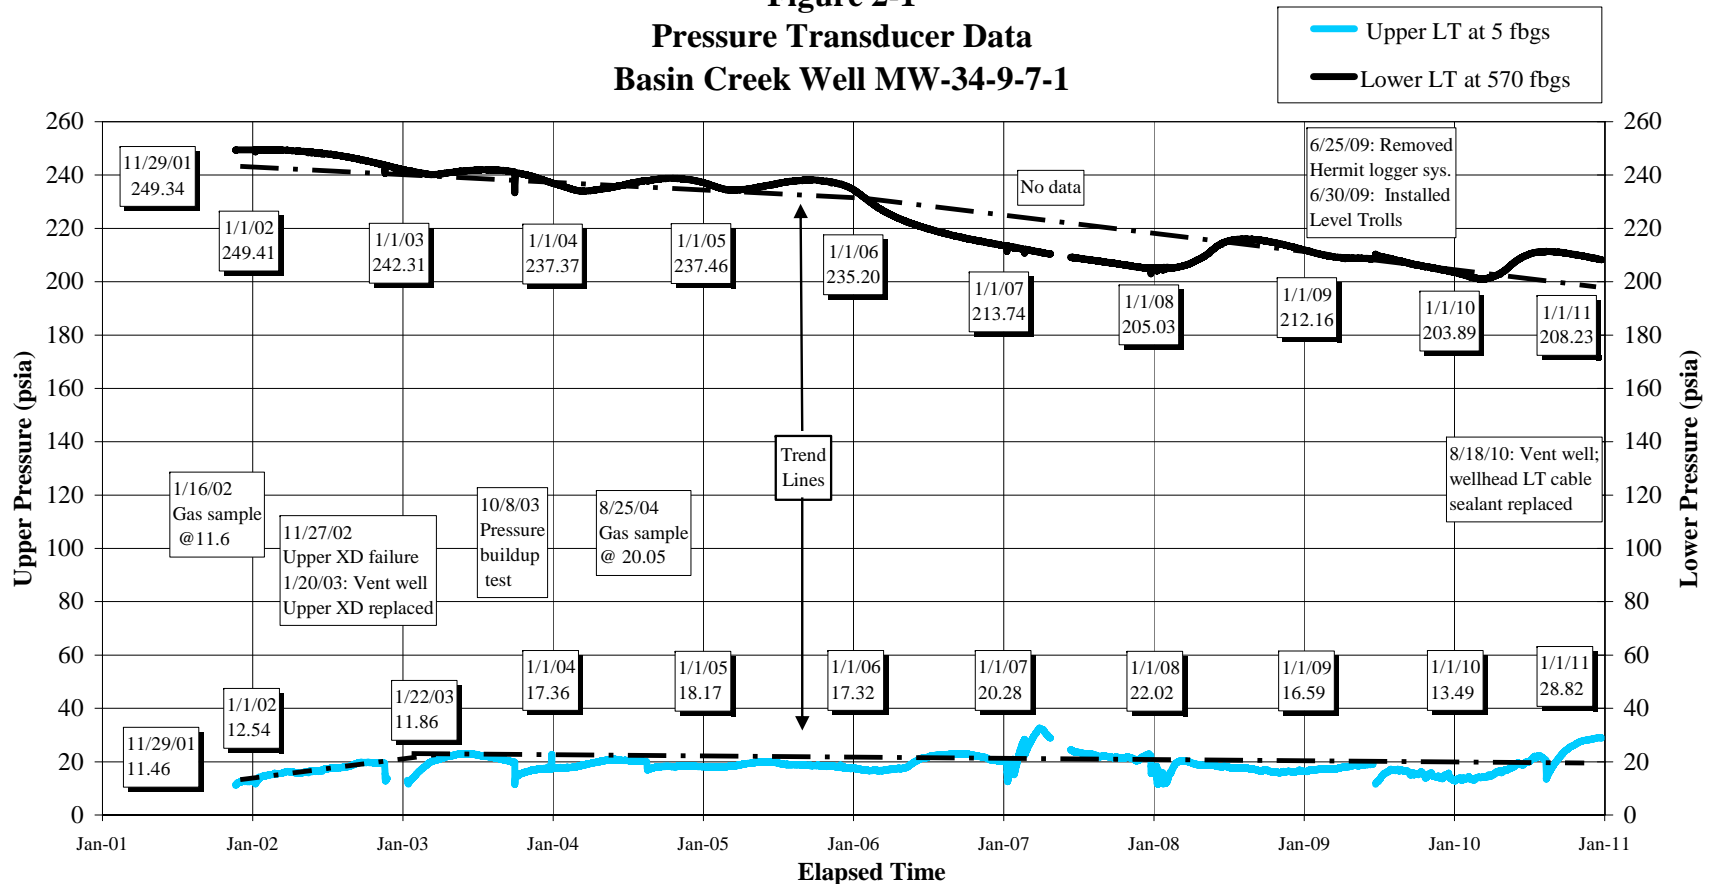

2.1.1 MW 34-9-7-1

Figure 2-1 charts the upper and lower pressure transducer data and the calculated water level in the well. Table 2-1 and Figure 2-1 show a net increase of 17.36 psi in wellhead pressure for the entire 9-year period of record from November 29, 2001 (11.46 psia) to January 1, 2011 (28.82 psia). Figure 2-1 generally shows a pattern of minor seasonal fluctuations within an overall flat trend in wellhead pressure prior to wellhead cable gland seal replacement on August 18, 2010, followed by a rise in wellhead pressure to a recorded high of 28.82 psia on January 1, 2011. Continued monitoring of wellhead

pressure is expected to show whether this recent rise is a short-term or long-term change in the pressure pattern prior to August 2010.

In contrast to the wellhead pressure patterns, Table 2-1 and Figure 2-1 show a net decline of about 134.95 feet in the calculated well water level and a corresponding net decline in down-hole pressure of about 41.11 psi for the period of record. Figure 2-1 also shows a pattern of slight seasonal fluctuations within the overall declining trend in the water level and corresponding down-hole pressure for the period of record.

**Figure 2-1
Pressure Transducer Data
Basin Creek Well MW-34-9-7-1**

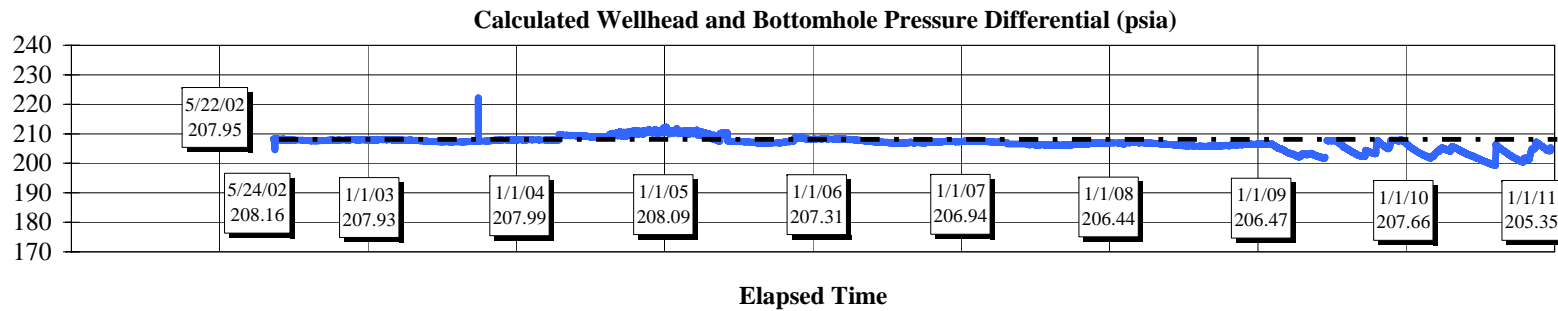

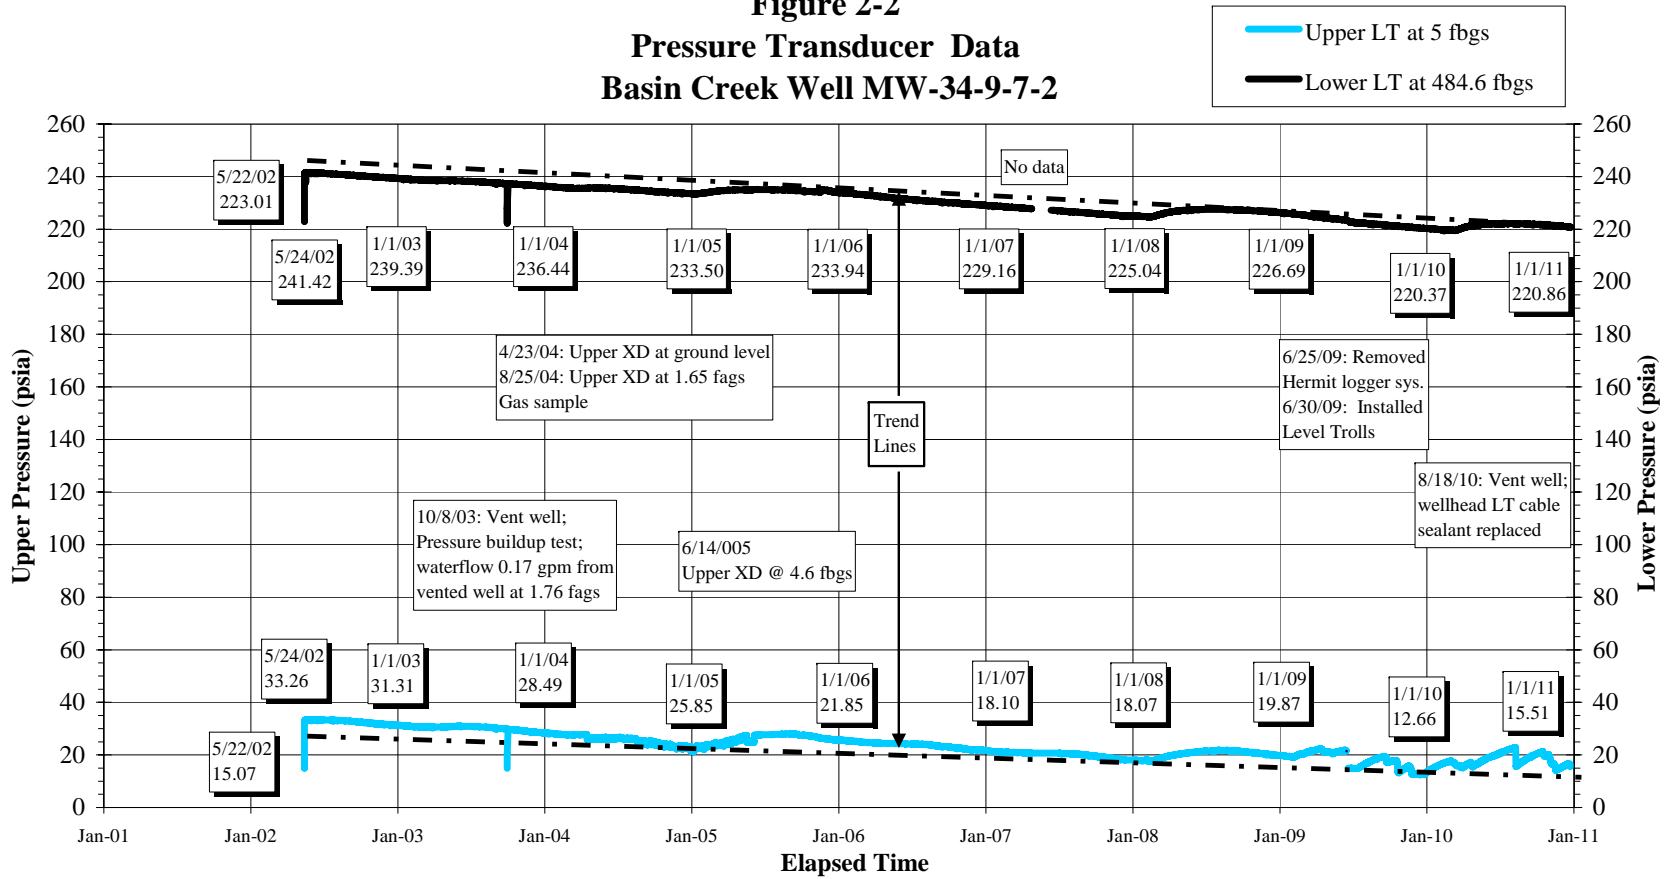

2.1.2 MW 34-9-7-2

Recorded pressure data and calculated down-hole and wellhead differential pressures for well MW-34-9-7-2 are charted on Figure 2-2. Initial and ending monitoring well pressures and apparent water level in the well are summarized in Table 2-1.

Figure 2-2 continues to show a trend of gradually declining wellhead pressure and slight seasonal fluctuations in down-hole pressure within the overall declining trend for the period of record. As indicated in Table 2-1, there has been a net decline in well pressure of about 17.75 psi (wellhead) and 20.56 psi (down-hole) for the 8.5-year period of record. Between February 18, 2008 and January 1, 2011, Figure 2-2 shows an apparent seasonal fluctuation within the overall declining well pressure trend.

As described in previous COGCC Monitor Wells Summary Reports, the chart on the bottom of Figure 2-2 shows the wellhead and down-hole pressure differential instead of the calculated water level in the well because the water level in the well has been above the upper transducer for the entire period of record. A small amount of gas was released and artesian flow (~0.2 gpm) from the well consistently occurred each time the well was vented for maintenance during the period of record between 2002 and 2010. Artesian flow from the well did not occur when the wellhead was vented on August 18, 2010 to replace the Level Troll wellhead cable Conax gland sealants. Continued monitoring of well pressure is expected to show whether or not the artesian water pressure regime has changed from the consistent pattern exhibited for the period of record prior to August 2010.

**Figure 2-2
Pressure Transducer Data
Basin Creek Well MW-34-9-7-2**

2.2 PALMER RANCH

Monitor well MW 35-8-19-1 has been monitored since November 20, 2009. Initial and ending well pressures and calculated water level in the monitor well are summarized in Table 2-2 for the indicated period of record. Both Level Troll cable wellhead Conax gland seal fitting Teflon sealants were replaced with cold temperature resistant Neoprene sealants on June 3, 2010.

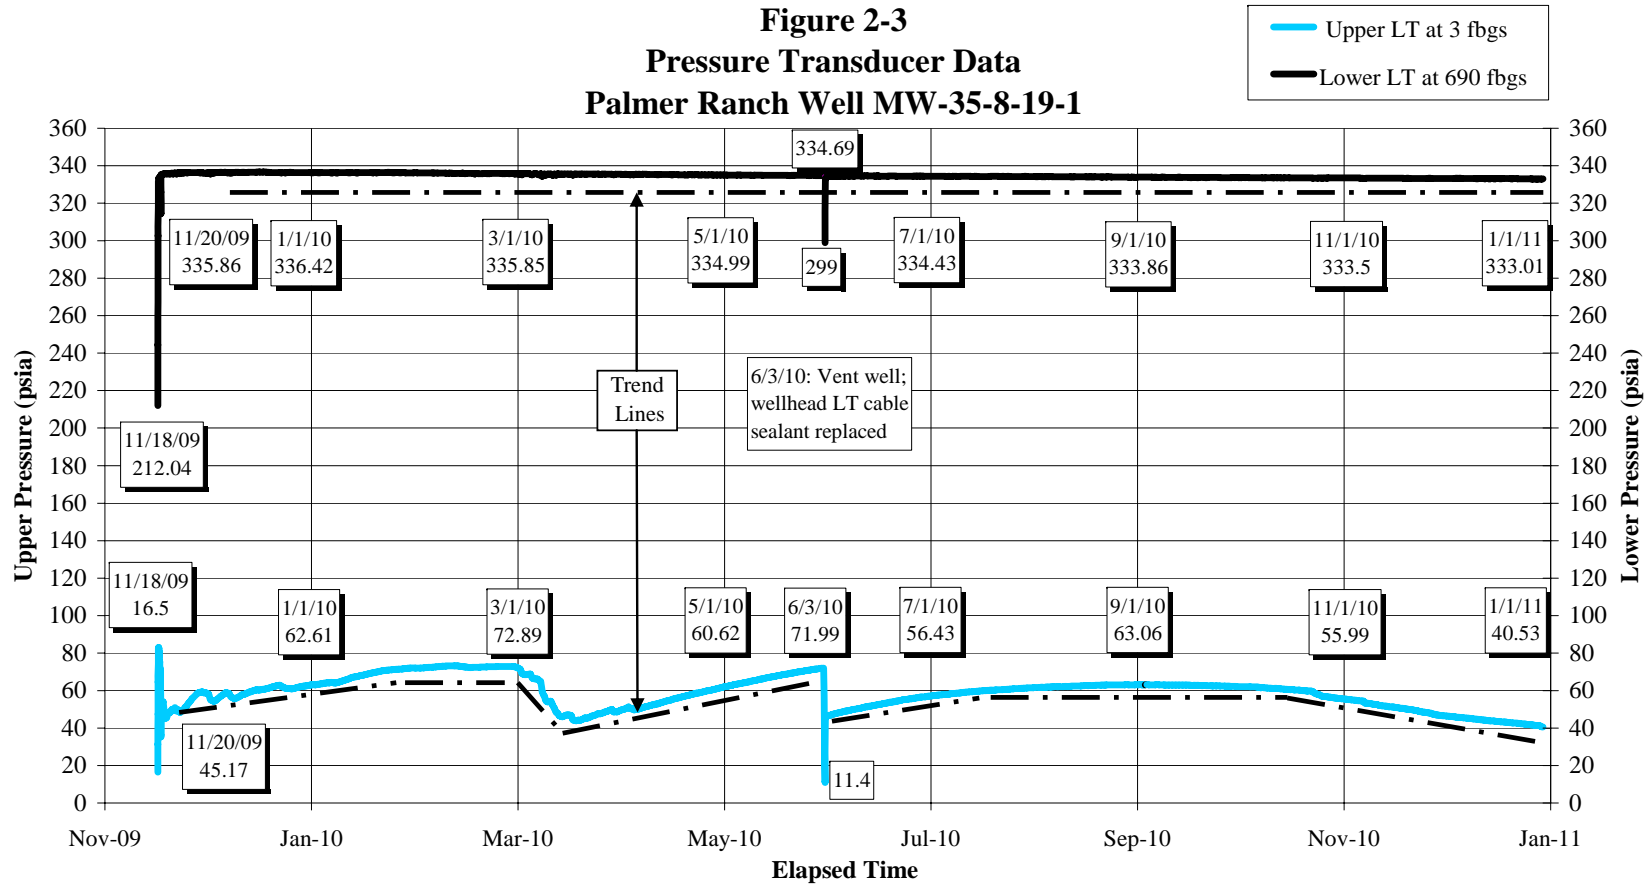

Table 2-2
Well Pressure Data Summary for Palmer Ranch Monitoring Well

Well ID and Transducers	Period of Record	Initial Shut In Well Pressure psia	Ending Shut In Well Pressure psia	Net Change in Well Pressure psi	Initial Water Level in Well fbgs	Ending Water Level in Well fbgs	Net Change in Water Level ft
MW 35-8-19-1 Upper	11/20/09 to 1/1/11	45.17	40.53	-4.64	19.09	14.96	4.13
Lower		335.86	333.01	-2.85			

Monitoring data for MW 35-8-19-1 are charted in Figure 2-3. Since November 20, 2009, there has been seasonal fluctuation in wellhead pressure and an overall flat trend in down-hole pressure. As summarized in Table 2-2 for the 1-year period of record, the net change in wellhead and down-hole pressures are -4.64 psi and -2.85 psi respectively. The net change in the calculated water level in the well is 4.13 feet for the period of record.

Figure 2-3 shows an immediate water level rise in response to the drop in well pressure when the well was vented for maintenance on June 3, 2010, followed by a gradual, partial return of the wellhead pressure and water level to trends exhibited prior to June 3, 2010. By August 1, 2010, the wellhead pressure and water level reached about 64 percent of trends exhibited prior to June 3, 2010, then levelled off until about October 23, 2010. Figure 2-3 also shows a trend of water level rise in response to a steady drop in wellhead pressure between October 23, 2010 and January 1, 2010. The drop in wellhead pressure after October 2010 may indicate an incomplete shut in condition or a seasonal water level fluctuation. An inspection of the well shut condition is scheduled for spring 2011 when all monitoring well sites are safely accessible.

Pressure Transducer Data
Palmer Ranch Well MW-35-8-19-1

2.3 FIDDLER

Monitor well MW 35-8-10-1 has been monitored since November 17, 2009. Initial and ending well pressures and calculated water level in the monitor well are summarized in Table 2-3 for the indicated period of record. Both Level Troll cable wellhead Conax gland seal fitting Teflon sealants were replaced with cold temperature resistant Neoprene sealants on June 2, 2010.

Well Pressure Data Summary for Fiddler Monitoring Well

Well ID and Transducers	Period of Record	Initial Shut In Well Pressure psia	Ending Shut In Well Pressure psia	Net Change in Well Pressure psi	Initial Water Level in Well fbg	Ending Water Level in Well fbg	Net Change in Water Level ft
MW 35-8-10-1 Upper	2/18/10 to 1/5/11	14.84	27.97	13.13	Upper transducer under water at 3 ft below ground surface		
Lower		184.3	195.32	11.02			

Monitoring data for MW 35-8-10-1 are charted in Figure 2-4. The net change in wellhead pressure is 16.9 psi and the net change in down-hole pressure is 15.79 psi for the 1-year period of record. As Figure 2-4 shows, both the wellhead pressure and down-hole pressure steadily increased from November 17, 2009 to June 3, 2010, while both the wellhead pressure and down-hole pressure show a gradually declining trend from June 4, 2010 to January 5, 2011. A net water level change was not calculated because to the upper transducer is under water. As noted on Figure 2-4, water flowed from the well at a rate of 0.25 gallons per minute (gpm) when the well was vented for maintenance on June 2, 2010. For charting purposes, the water level in the shut in well is estimated to be at or near ground surface above the upper pressure transducer (set at 3 fbg).

Also noted on Figure 2-4, telemetry system communication with the In-Situ[®] Data Center for the upper transducer was lost from November 26, 2009 through February 11, 2010 due to cable connection problem, and was intermittent from December 19, 2010 to January 1, 2011. A well instrumentation inspection is scheduled for spring 2011 when the site is safely accessible.

**Figure 2-4
Pressure Transducer Data
Fiddler Well MW-35-8-10-1**

2.4 SOUTH FORK TEXAS CREEK

Monitor wells MW 35-7-8-1 and MW 35-7-8-2 have been monitored since November 29, 2001. Initial and ending well pressures and calculated water levels in the monitor wells are summarized in Table 2-4 for the indicated period of record. All Level Troll cable wellhead Conax gland seal fitting Teflon sealants were replaced with cold weather resistant Neoprene sealants on August 18, 2010

Table 2-4
Well Pressure Data Summary for South Fork Texas Creek Monitoring Wells

Well ID and Transducers	Period of Record	Initial Shut In Well Pressure psia	Ending Shut In Well Pressure psia	Net Change in Well Pressure psi	Initial Water Level in Well fbgs	Ending Water Level in Well fbgs	Net Change in Water Level ft
MW 35-7-8-1 Upper	12/01/01 to 1/1/11	13.79	49.25	35.46	88.39	156.13	-67.74
Lower		144.47	143.69	-0.78			
MW 35-7-8-2 Upper	1/15/02 to 1/1/11	91.32 ¹	63.92	-27.40	Water level in well is >225 fbgs with complete shut in		
Lower		91.91 ¹	66.49	-25.42			

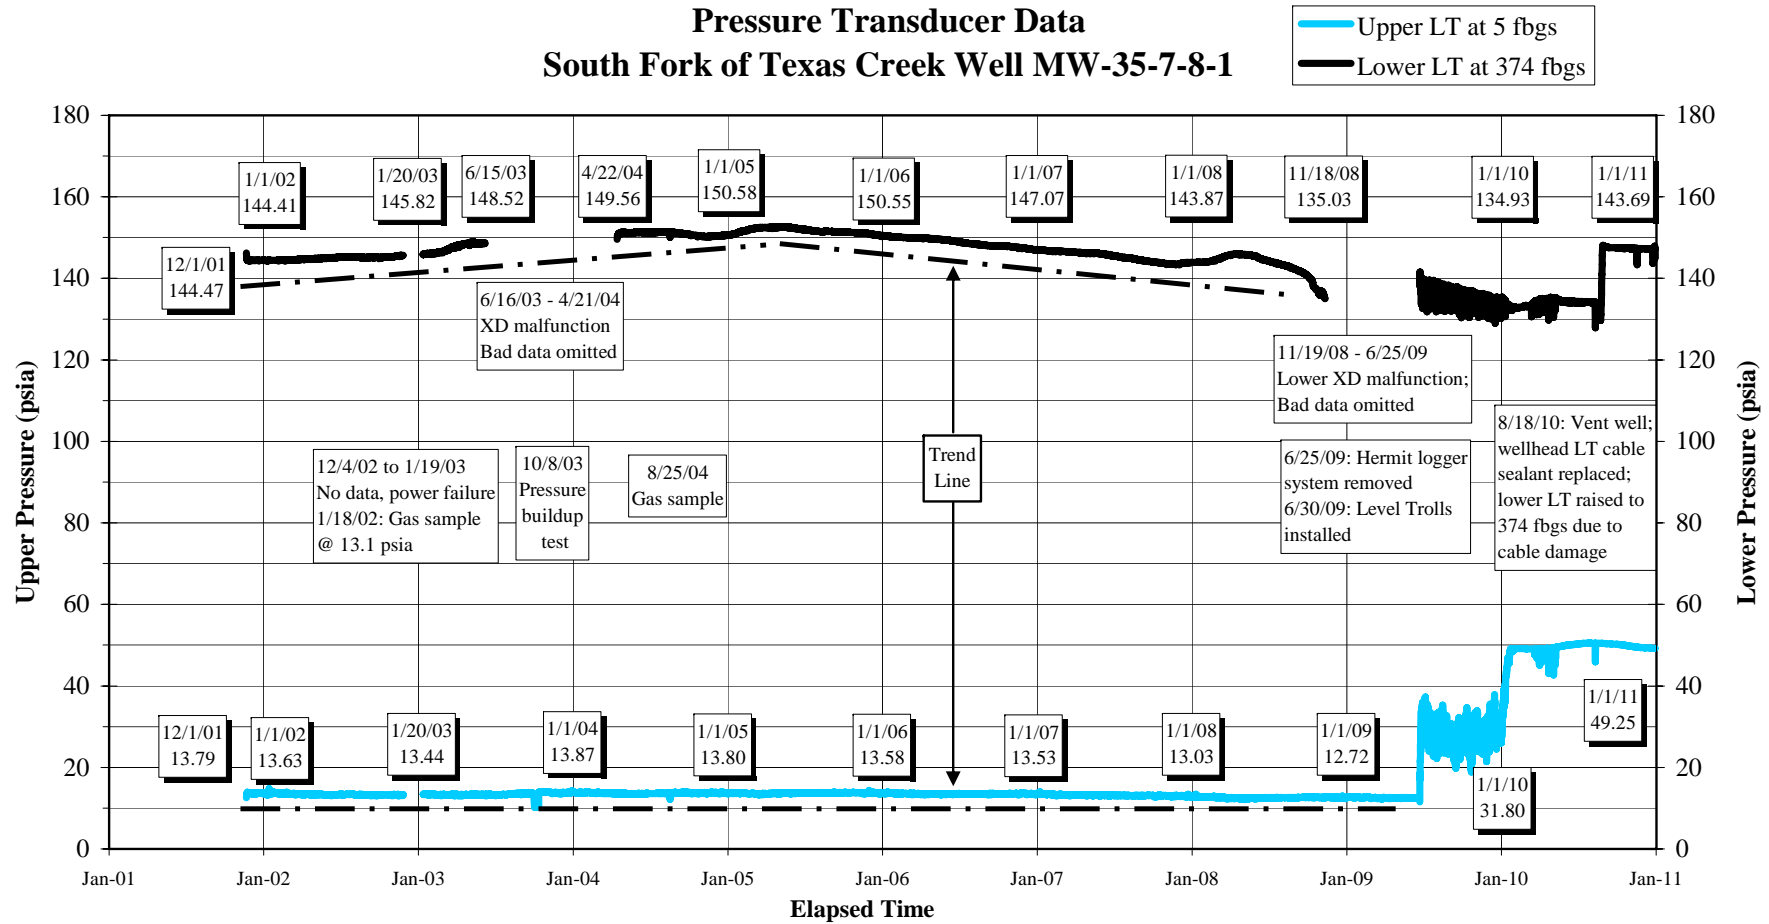

¹ Both down-hole and wellhead pressure are typically the same in MW 35-7-8-2 with complete shut in.

2.4.1 MW 35-7-8-1

Monitoring data for MW 35-7-8-1 are charted in Figure 2-5. As summarized in Table 2-4, the net change in wellhead and down-hole pressures is 35.46 psi and -0.78 psi respectively for the 9-year period of record. The net change in the calculated water level in the well is -67.74 feet.

Figure 2-5 shows a relatively stable wellhead pressure (12 to 13.5 psia) prior to installation of the Level Troll instrument on June 30, 2009. After the transducer change-out, there was a build up in wellhead pressure from 11.52 psia on June 30, 2009 to 33.76 psia on July 3, 2009 followed by frequent fluctuations in wellhead pressure ranging between 19 psia and 38 psia through January 18, 2010. Between January 19, 2010 and January 30, 2010, the wellhead pressure rose from 38 psia to 49 psia and then remained fairly stable through January 1, 2011. The relatively stable wellhead pressure curve prior to June 30, 2009 is inconsistent with the fluctuating and notably higher pressure measurements recorded after June 30, 2009. Likewise, the lower Level Troll has recorded frequent down-hole pressure fluctuations (between 129 and 142 psia) not previously observed in well pressure data prior to June 30, 2009. The higher well pressure regime since August 2010 may indicate complete well shut in was not achieved until after the Level Troll cable wellhead seals were replaced on August 18, 2010.

Figure 2-5
Pressure Transducer Data
South Fork of Texas Creek Well MW-35-7-8-1

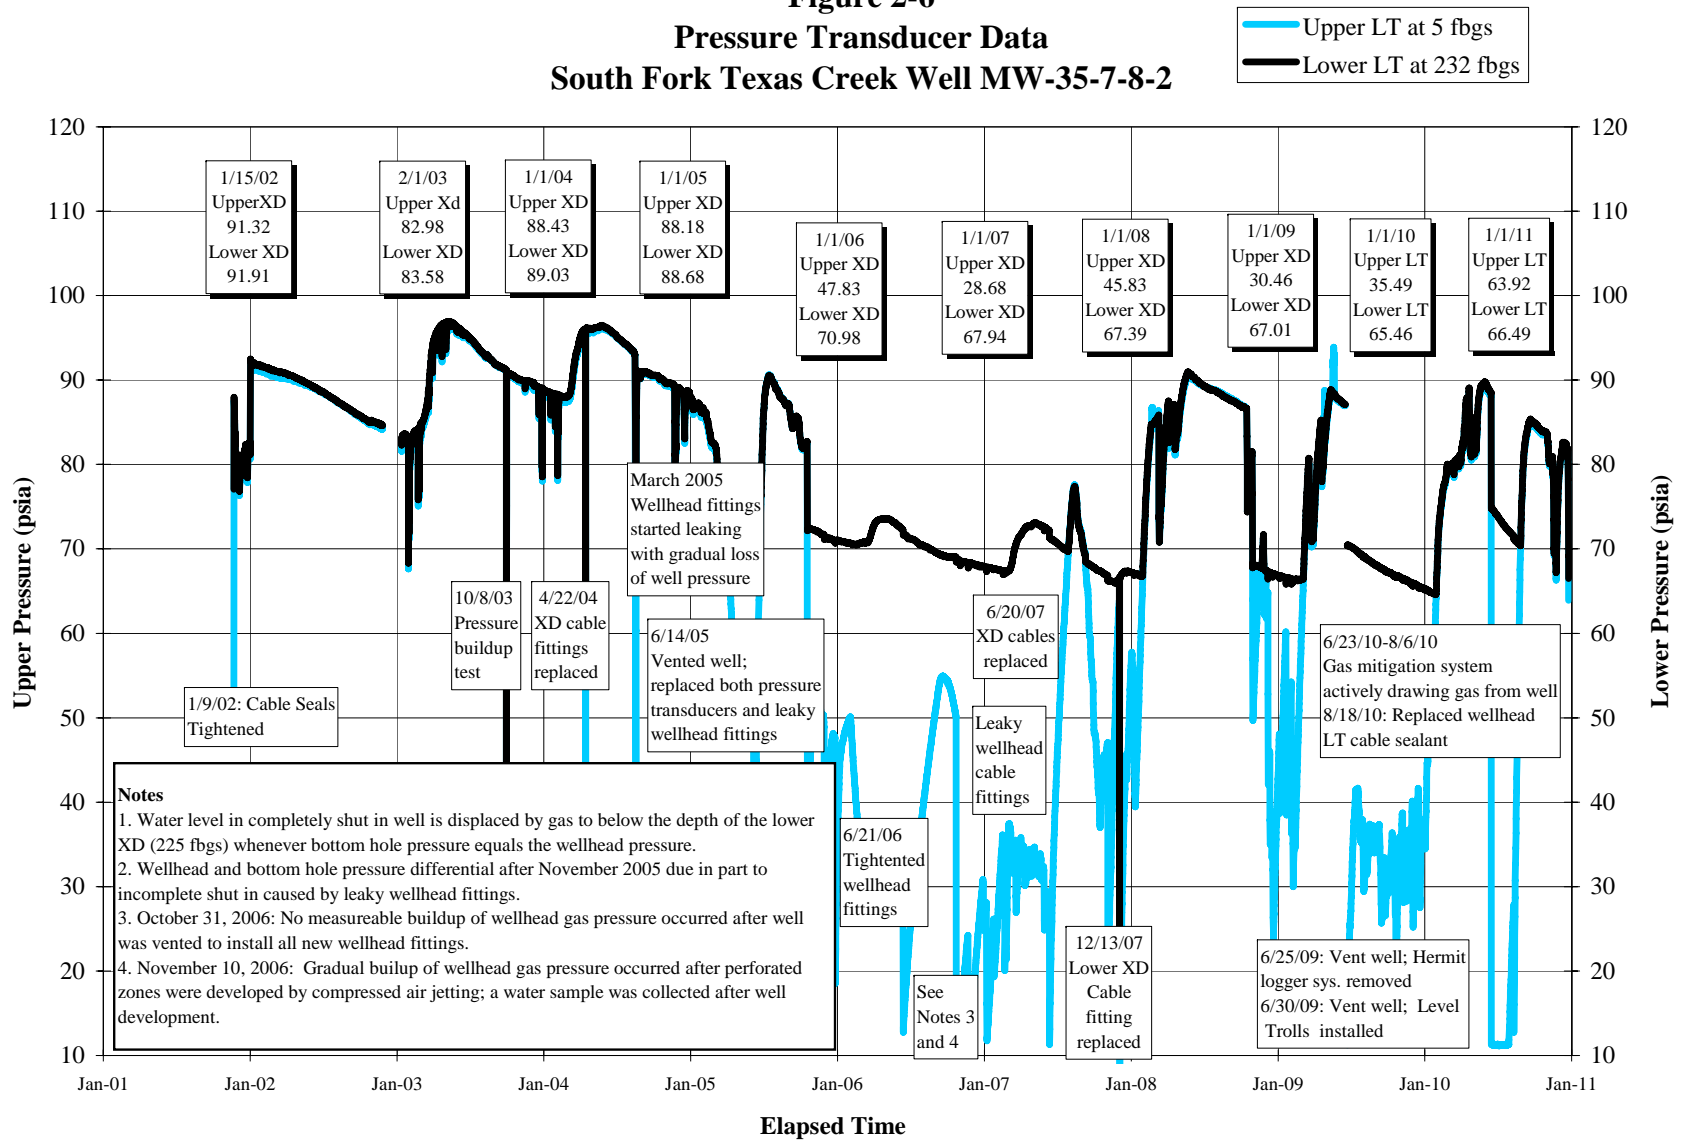

2.4.2 MW 35-7-8-2

Figure 2-6 charts the pressure data for well MW 35-7-8-2, which exhibits an entirely different pressure regime than the deeper monitoring well MW 35-7-8-1. Figure 2-6 shows nearly equal wellhead and down-hole pressures for the period of record when the well is completely shut in. For example, wellhead and down-hole pressures recorded on December 31, 2010 were 80.3 psia and 80.62 psia respectively under shut-in conditions. Based on the period of record to data, incomplete well shut in is indicated whenever the well pressure drops below about 70 psia.

Well MW 35-7-8-2 was spliced, via PVC pipeline, into the South Fork gas mitigation system in June 2010 to test if there was enough gas in the well to supplement the larger-scale gas recovery and electrical generation system located along South Fork Texas Creek. The well was opened to the mitigation system on June 23, 2010. At 06:00 hours, the recorded wellhead and down-hole pressures were about 88 psia. At 18:00 hours on June 23, 2010, the recorded wellhead pressure had dropped to 11.31psia (atmospheric pressure) and the down-hole pressure had dropped to about 74.8 psia. The well was removed from the gas mitigation system on August 6, 2010 due to lack of demonstrated performance. At that time, the recorded wellhead pressure was still about 11.3 psia and the down-hole pressure was about 71 psia. The initial well pressure, 88 psia, was not sustained during system operation and there was no decrease in gas recovery system performance when the well was shut in on August 6, 2010. The well did not contribute enough gas to improve the gas recovery system operation.

Figure 2-6 shows a fairly rapid increase in well pressure after the well was shut in on August 18, 2010. The peak build up pressure of about 85 psia on September 28, 2010 was followed by an erratic decline in well pressure. On January 1, 2011, the wellhead pressure was 63.92 psia and the down-hole pressure was 66.49 psia, which may suggest an incomplete well shut in condition. An inspection of the well shut in condition is scheduled for the spring of 2011 when the site is safely accessible.

Pressure Transducer Data
South Fork Texas Creek Well MW-35-7-8-2

2.5 BP HIGHLANDS

Monitor well MW 34-7-15-1 has been monitored since November 19, 2009. Initial and ending well pressures and calculated water levels in the monitor well are summarized in Table 2-5 for the indicated period of record. Both Level Troll cable wellhead Conax gland seal fitting Teflon sealants were replaced with cold weather resistant Neoprene sealants on June 3, 2010

Table 2-5
Well Pressure Data Summary for BP Highlands Monitoring Well

Well ID and Transducers	Period of Record	Initial Shut In Well Pressure psia	Ending Shut In Well Pressure psia	Net Change in Well Pressure psi	Initial Water Level in Well fbgs	Ending Water Level in Well fbgs	Net Change in Water Level ft
MW 34-7-15-1 Upper	11/19/09 to 1/1/11	11.09	8.52	-2.57	3.13	0.64	2.49
Lower		98.12	96.63	-1.49			

Monitoring data for MW 34-7-15-1 are charted in Figure 2-7. As summarized in Table 2-5 for the 1-year period of record, the net change in down-hole pressures is 1.49 psi. The wellhead pressure curve and the down-hole pressure curve follow the same trend with an initial rise in pressure through April 1, 2010 then a steady decline through late December 2010. The net change in the calculated water level in the well is 2.49 feet. As noted on Figure 2-7, water flowed from the well at a rate of 0.25 gallons per minute (gpm) when the well was vented for maintenance on June 3, 2010. For charting purposes, the water level in the shut in well is estimated to be slightly above ground surface with the upper transducer under water at 2 fbgs.

The wellhead pressure started dropping below atmospheric pressure around August 12, 2010. This condition suggests either a potential problem with the upper transducer or a well pressure vacuum effect created in a completely shut-in well under declining water level conditions. A well instrumentation inspection and barometric pressure check are scheduled for spring 2011 when the site is safely accessible.

**Figure 2-7
Pressure Transducer Data
BP Highlands Well MW-34-7-15-1**

2.6 BEAVER CREEK RANCH

Well MW 35-6-17-1 has been monitored since May 21, 2002 and well MW 35-6-17-2 has been monitored since November 30, 2001. On July 17, 2009 the Hermit data logger and PXD transducers were replaced with Level Troll instruments. Initial and ending well pressures and calculated water levels in the monitor wells are summarized in Table 2-6 for the indicated period of record. All Level Troll cable wellhead Conax gland seal fitting Teflon sealants were replaced with cold weather resistant Neoprene sealants after both wells were vented on August 18, 2010.

Table 2-6
Well Pressure Data Summary for Beaver Creek Ranch Monitoring Wells

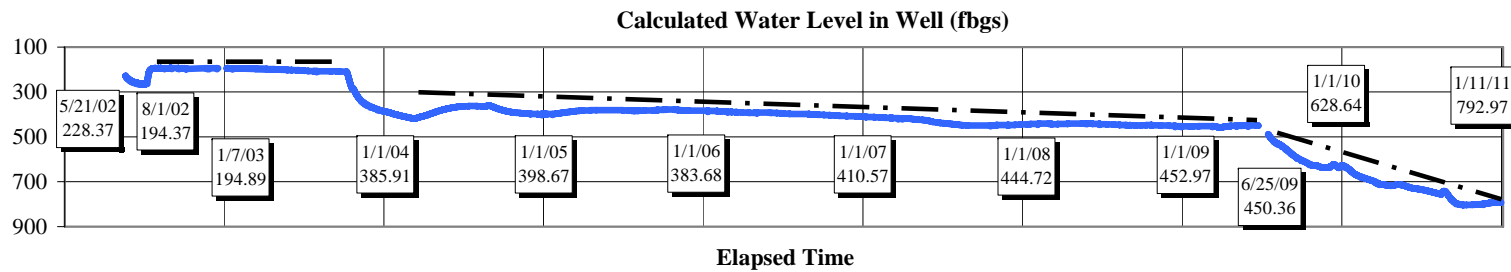

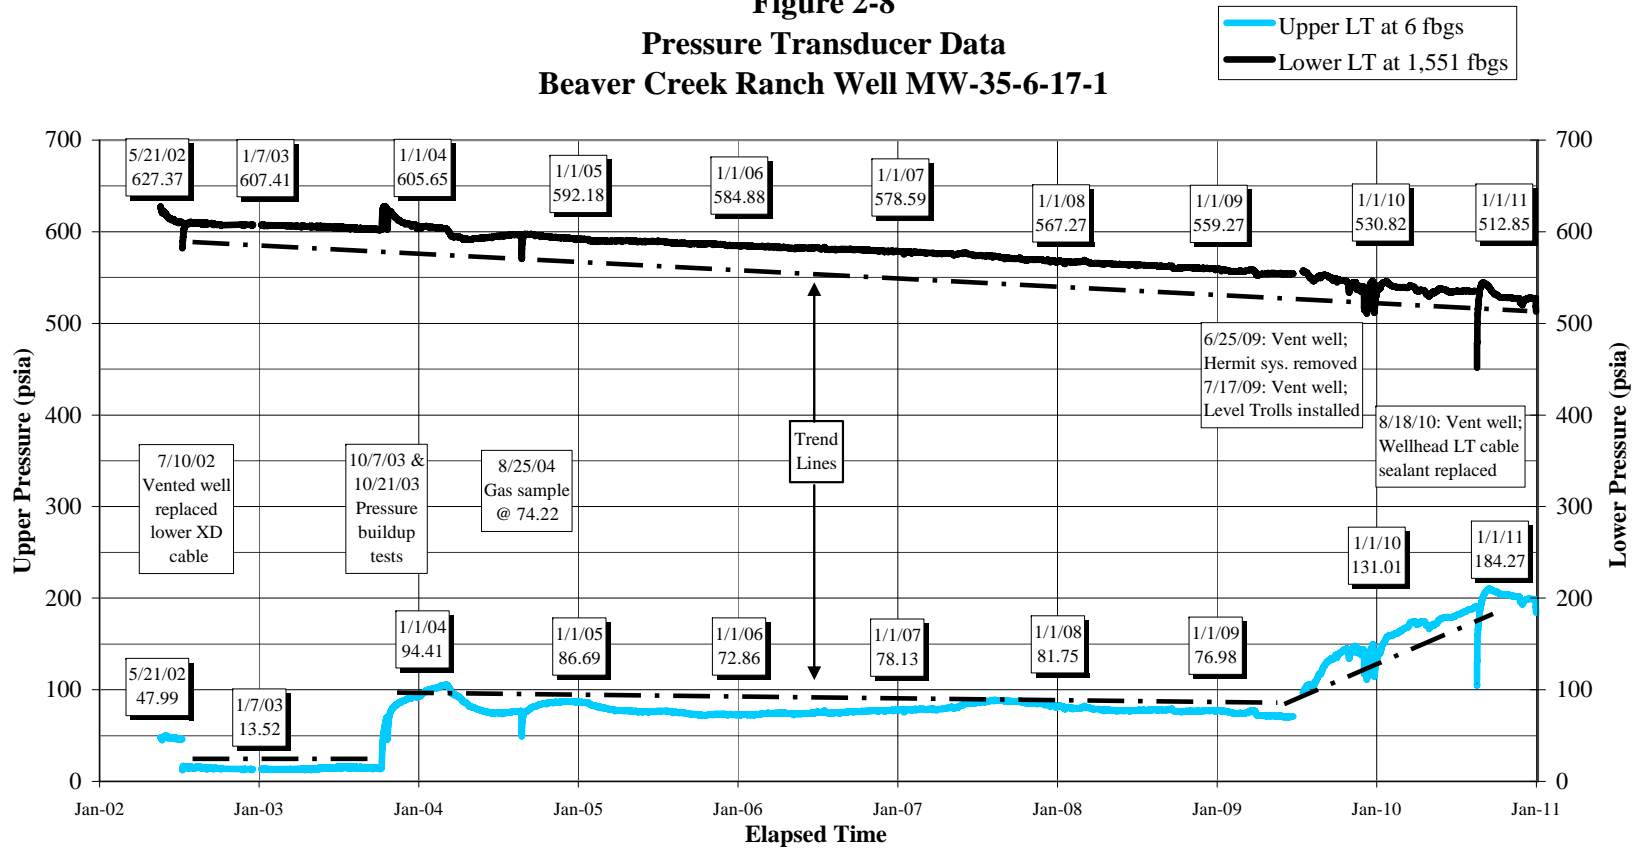

Well ID and Transducers	Period of Record	Initial Shut In Well Pressure psia	Ending Shut In Well Pressure psia	Net Change in Well Pressure psi	Initial Water Level in Well fbgs	Ending Water Level in Well fbgs	Net Change in Water Level ft
MW 35-6-17-1 Upper	08/01/02 to 1/1/11	15.44	184.27	168.83	194.37	792.97	-598.60
Lower		609.55	512.85	-96.70			
MW 35-6-17-2 Upper	06/15/02 to 1/1/11	614.27	468.16	-146.11	1,377.64	1,374.74	2.90
Lower		632.63	482.49	-150.14			

2.6.1 MW 35-6-17-1

Monitoring data for well MW 35-6-27-1 are charted on Figure 2-8. As shown in Table 2-6, the pressure regime for this well is different than the regime exhibited by well MW 35-6-17-2.

Table 2-6 and Figure 2-8 show a net increase of 168.83 psi in wellhead pressure, a net decline of 96.7 psi in down-hole pressure and a corresponding net decline of 589.6 feet in the water level in the well for the entire 8-year period of record. Figure 2-8 also shows a steady decline in bottom-hole pressure curve for the period of record, while the wellhead pressure curve shows two notable increases in the well pressure regime. Both increases in wellhead pressure suggest stimulation of gas flow into the well with corresponding declines in the water level occurred in response to venting the well in July 2003 and again in June and July 2009. The well will be vented again next spring when the site is safely accessible to determine if venting of the well will stimulate another build up of even higher gas pressure in the well.

Figure 2-8
Pressure Transducer Data
Beaver Creek Ranch Well MW-35-6-17-1

2.6.2 MW 35-6-17-2

Wellhead pressure, down-hole pressure, and calculated well water level data for well MW 35-6-17-2 are charted in Figure 2-9 and summarized in Table 2-6 for the period of record. Monitoring of down-hole pressure was terminated after the lower transducer was removed from the well for the period of record between April 22, 2004 and June 25, 2009. The Hermit data logger and wellhead PXD pressure transducer were removed on June 25, 2009. New wellhead and down hole Level Trolls were installed in well MW 35-6-17-2 on July 17, 2009 to enable future monitoring of both wellhead and down-hole pressure regimes and the water level in the well.

Figure 2-9 shows the well pressure in a declining trend for the entire period record. There is a notable shift in the well pressure curve following the installation of Level Troll instruments on July 17, 2009, followed by erratic well pressure spikes associated with incomplete shut in through August 17, 2010. After the well was vented August 18, 2010 to replace the Level Troll cable fitting sealants, there was a steady build up of well pressure through early September 2010 followed by a return to the historic declining trend through December 2010.

As shown on Figure 2-9, no water level data is available for the 6-year period of record when there was only one well pressure transducer. Well pressure data available after installation of wellhead and down-hole Level Trolls on July 19, 2009 shows essentially no change in the water level. The calculated water level was 1,375.9 fbgs on April 22, 2004 as compared with 1,374.74 fbgs on January 1, 2011.

Figure 2-9
Pressure Transducer Data
Beaver Creek Ranch Well MW-35-6-17-2

2.7 SHAMROCK MINES

Well MW 35-6-13-1 monitoring data are charted in Figures 2-10 and summarized in Table 2-7 for the entire 8.5-year period of record. Since there are no producing wells in close proximity to this area, this well is used to collect background data and has been monitored continuously since May 22, 2002. Both Level Troll cable wellhead Conax gland seal fitting Teflon sealants were replaced with Neoprene sealants after the well was vented on June 2, 2010. In addition, the upper Level Troll was raised to ground level on June 3, 2010 to repair cable damage that occurred when the wellhead cable sealant was replaced on June 2, 2010.

Table 2-7
Well Pressure Data Summary for Shamrock Mines Monitoring Well

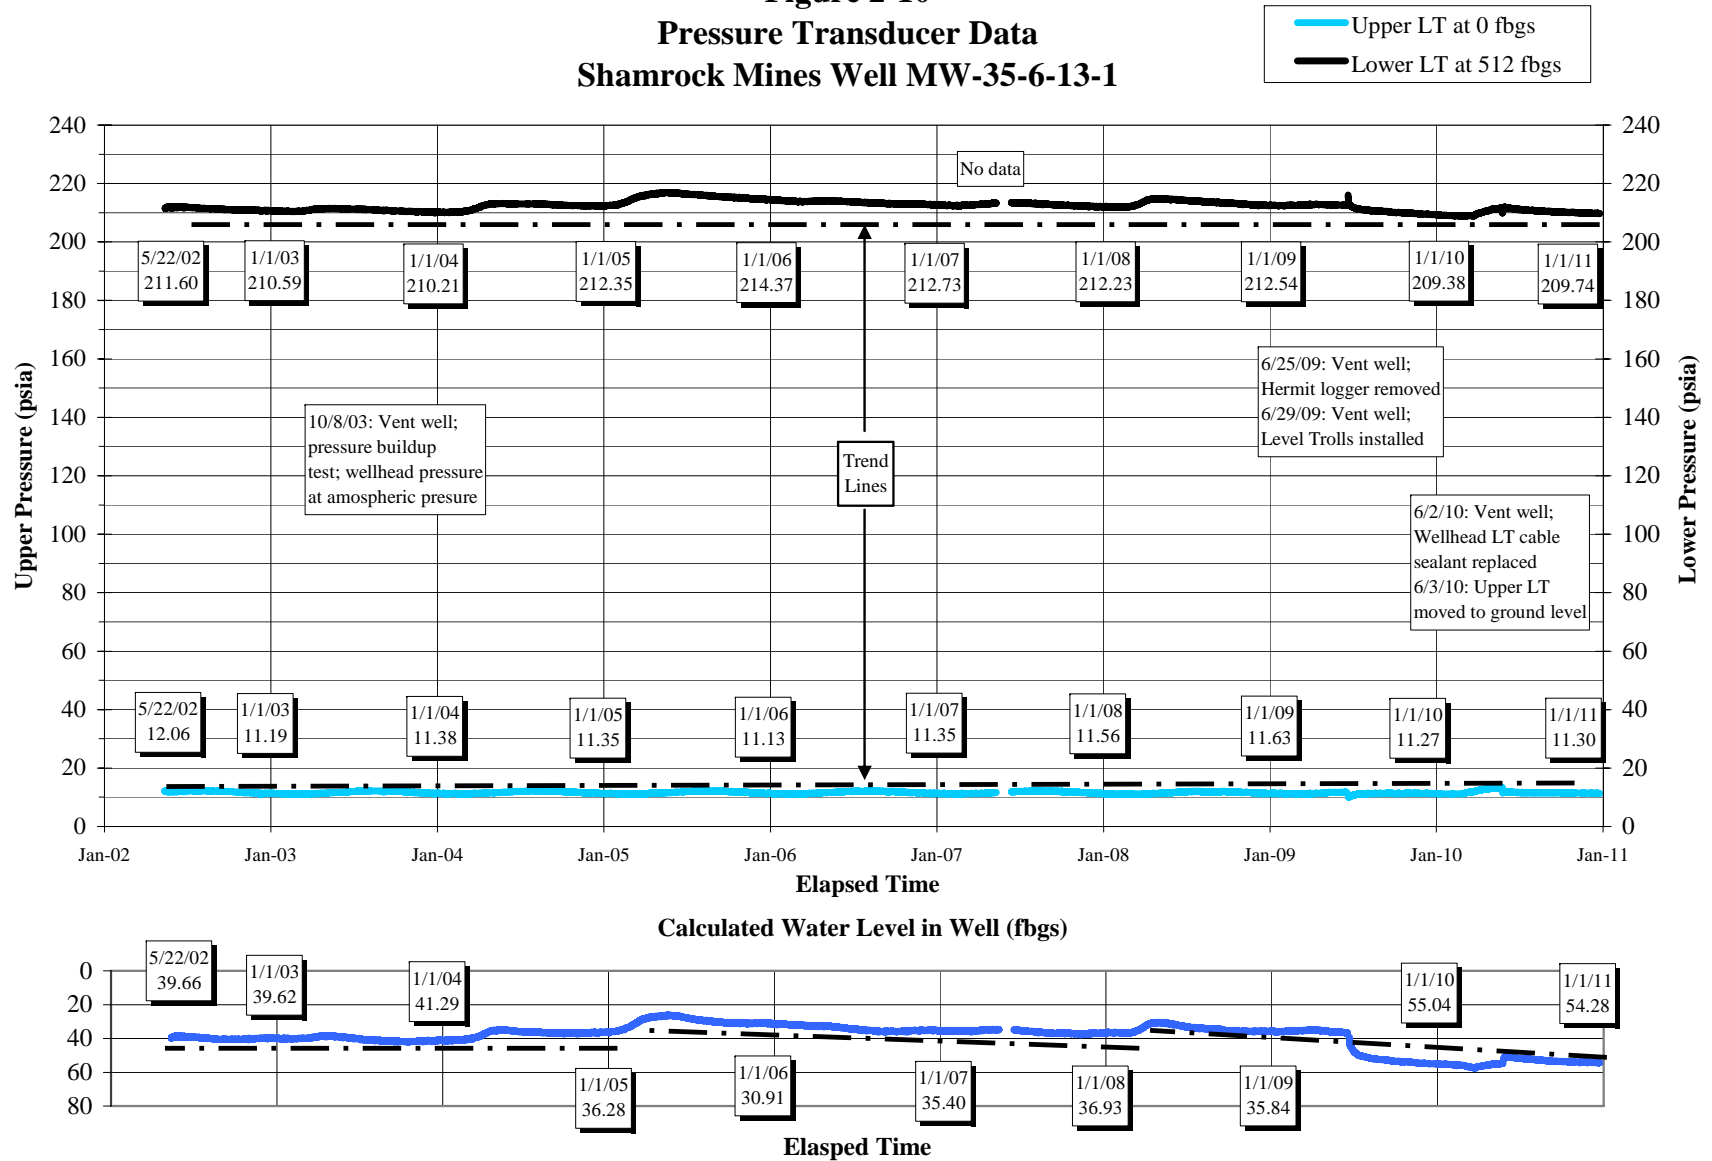

Well ID and Transducers	Period of Record	Initial Shut In Well Pressure psia	Ending Shut In Well Pressure psia	Net Change in Well Pressure psi	Initial Water Level in Well fbg	Ending Water Level in Well fbg	Net Change in Water Level ft
MW 35-6-13-1 Upper	5/22/02 to 1/1/10	12.06	11.30	Atmospheric Pressure	39.66	54.28	-14.62
Lower		211.60	209.74	-1.86			

¹ On May 26, 2005, the measured down-hole pressure (216.89 psia) and calculated depth to water (26.53 ft) in well MW 35-6-13-1 were at their highest levels for the period of record.

Figures 2-10 shows the wellhead pressure regime continues to be at atmospheric pressure and fluctuates within a range of 2 psi (between 10 psia and 12 psia). During the months of April and May 2010, the wellhead pressure steadily increased to around 13.4 psia. Wellhead pressure returned to the historic atmospheric pressure trend after the Level Troll wellhead cable sealants were replaced on June 2, 2010.

Figure 2-10 also shows the down-hole pressure and calculated water level in the well continued to exhibit a similar pattern of seasonal fluctuation within the overall declining well pressure trend for the period of record since April 2005. With wellhead pressure equal to atmospheric pressure, fluctuation of down-hole pressure is attributable to the fluctuation of the water level in the well.

Figure 2-10
Pressure Transducer Data
Shamrock Mines Well MW-35-6-13-1

3.0 ARCHULETA COUNTY MONITORING WELL DATA SUMMARY

Monitoring well pressure was measured and recorded twice daily (12-hour interval) at the 4 monitoring well sites located in Archuleta County, Colorado. Applicable well pressure and calculated water level data for the entire period of record for each monitoring well are plotted in annotated charts.

3.1 WAGON GULCH

Monitor wells MW 34-5-4-1 and MW 34-5-4-2 have been monitored since December 2, 2008. Initial and ending monitoring well pressures and calculated water levels in the wells for the period of record are summarized in Table 3-1. Both well MW 34-5-4-2 Level Troll cable wellhead Conax gland seal fitting Teflon sealants were replaced with a Neoprene sealant on August 17, 2010, while only the lower Level Troll wellhead cable sealant was replaced at well MW 34-5-4-1.

**Table 3-1
Well Pressure Data Summary for Wagon Gulch Monitoring Wells**

Well ID and Transducers	Period of Record	Initial Shut In Well Pressure psia	Ending Shut In Well Pressure psia	Net Change in Well Pressure psi	Initial Water Level in Well fbgs	Ending Water Level in Well fbgs	Net Change in Water Level ft
MW 34-5-4-1 Upper	12/26/08 to 12/31/10	50.14	18.05	-32.09	650.74	223.39	427.35
Lower		131.88	285.21	153.33			
MW 34-5-4-2 Upper	5/1/09 to 1/1/11	48.5	50.08	1.58	Upper transducer is under water at 2.5 ft below ground level		
Lower		391.07	379.40	-11.67			

3.1.1 MW 34-5-4-1

Figure 3-1 charts the upper and lower pressure transducer data and the calculated water level in the well. Although the well was shut in for monitoring on December 2, 2008, the wellhead pressure did not reach an initial stable pressure of about 50.1 psia until December 26, 2008, 24 days after shut in. Table 3-1 and Figure 3-1 show a 32.09 psi net decline in wellhead pressure for the entire 2-year period of record from December 26, 2008 (50.14 psia) to December 31, 2010 (18.05 psia). Figure 3-1 shows the trend of decreasing wellhead pressure continued in 2010 until the trend reversed in mid-November 2010. Between November 14, 2010 and December 31, 2010, the wellhead pressure curve on Figure 3-1 shows a steady increase in pressure from about 11 psia to 18.05 psia.

Table 3-1 and Figure 3-1 show a net increase in down-hole pressure of 153.33 psi for the entire 2-year period of record from December 26, 2008 (131.88 psia) to January 3, 2011 (285.21psia). The well pressure increase is primarily attributable to the 427 feet of net water level rise in the well since December 26, 2008. Figure 3-1 shows the trend of rising water level with corresponding increasing down-hole pressure continued in 2010 until the trend reversed in mid-September 2010. Between October 1, 2010 and December 31, 2010, Figure 3-1 shows the water level decreased about 21.2 feet while the down-hole pressure decreased about 2.7 psia

**Figure 3-1
Pressure Transducer Data
Wagon Gulch Well MW-34-5-4-1**

Calculated Water Level in Well (fbs)

3.1.2 MW 34-5-4-2

Figure 3-2 charts the upper and lower pressure transducer data and the estimated water level in the well. Although the well was shut in for monitoring on December 4, 2008, a well pressure build up to a stable down-hole pressure of about 391 psi and wellhead pressure of about 47-48 psia were not confirmed until May 2009. No data are available from February 15, 2009 to April 23, 2009 due to pressure transducer malfunction.

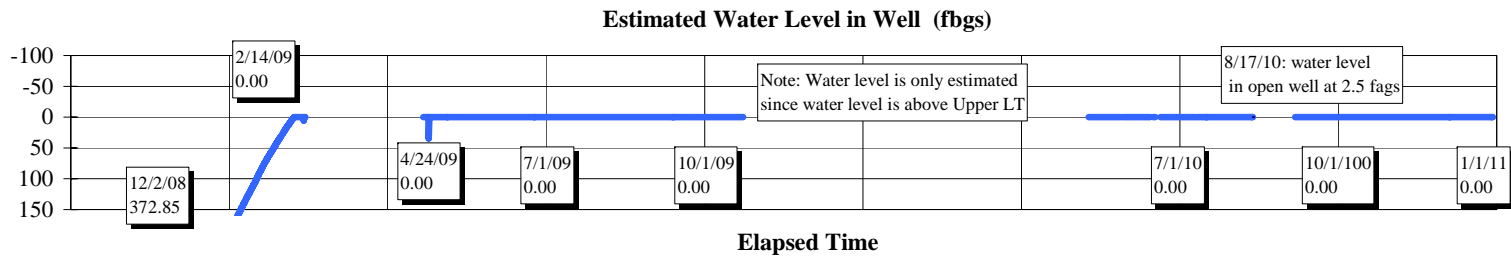

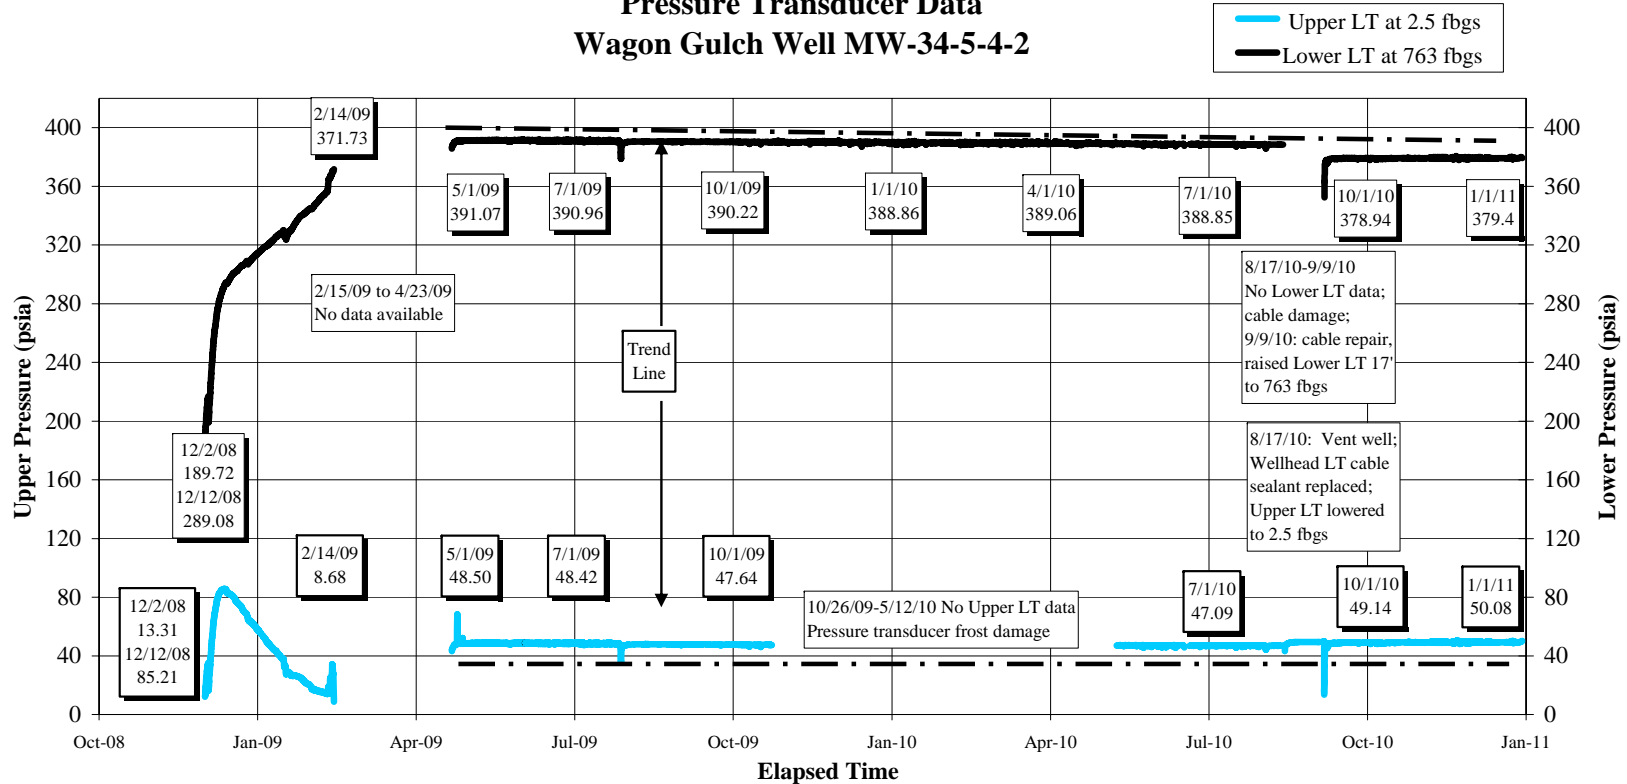

Figure 3-2 shows a relatively constant wellhead pressure of about 47 - 48 psia between April 24, 2009 and October 25, 2009. Erratic pressure spiking pattern between October 26, 2009 and May 12, 2010 suggested wellhead Level Troll pressure sensor freeze damage, so the data were omitted from Figure 3-2. Between May 13, 2010 and August 16, 2010 the wellhead pressure remained fairly constant at around 47 psia

Freeze damage to the upper Level Troll pressure transducer sensor was confirmed after the well was vented on August 17, 2010. As noted on Figure 3-2, the water level inside the open wellhead was at a height of about 2.5 feet above ground level. The new upper Level Troll was changed from an external mount to an internal depth setting of 2.5 fbg on August 17, 2010 to protect the transducer sensor from freezing conditions. After well shut in on August 17, 2010, Figure 3-2 shows a relatively rapid return of wellhead pressure to an average constant pressure of about 50 psia.

The lower Level Troll cable was damaged during replacement of Level Troll wellhead cable sealants on August 17, 2010. Cable repair performed on September 9, 2010 included raising the Level Troll 17 feet from 780 fbg to 763 fbg. As a result of this change, Figure 3-2 shows a shift in the down-hole pressure curve to a corrected constant down-hole pressure regime of 378-379 psia.

As noted above, the water level was inside the open wellhead at a height of about 2.5 feet above ground level on August 17, 2010. The wellhead pressure buildup after shut in may reflect water and/or gas pressure build up. For charting purposes, the water level in the shut in well is estimated to be at or near ground surface above the upper Level Troll (set at 2.5 fbg). However, there is a possibility that the observed build up in wellhead pressure is from gas pressure, which could result in a downward displacement of the water in the well to some level below the upper Level Troll. The current monitoring scheme for observing shut in well pressure does not include the capability of determining the source(s) of wellhead pressure build up in response to complete well shut in. As an alternative, the well will be vented next spring when the site is safely accessible to check for artesian water flow from the well and/or venting of gas under atmospheric pressure conditions.

**Figure 3-2
Pressure Transducer Data
Wagon Gulch Well MW-34-5-4-2**

3.2 FOSSET GULCH

Monitor wells MW 34-5-14-1 and MW 34-5-14-2 have been monitored since December 4, 2008. This report only includes the period of record ending November 11, 2010 when pipeline construction damaged the cables between each wellhead and the telemetry communication hub. Cable repair work and download of stored Level Troll data is planned for spring 2011 when the site is safely accessible.

Initial and ending monitoring well pressures and calculated water levels in the wells for the period of record are summarized in Table 3-2. The lower Level Troll cable wellhead Conax gland seal fitting Teflon sealant was replaced with a Neoprene sealant after both wells were vented on August 17, 2010.

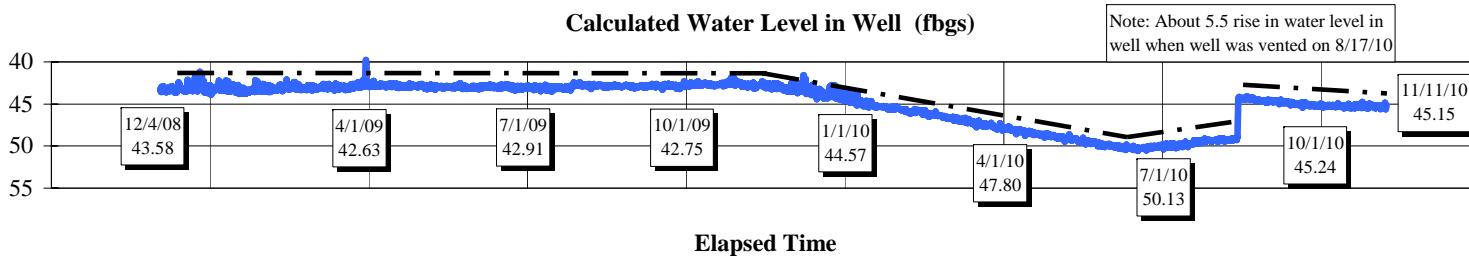

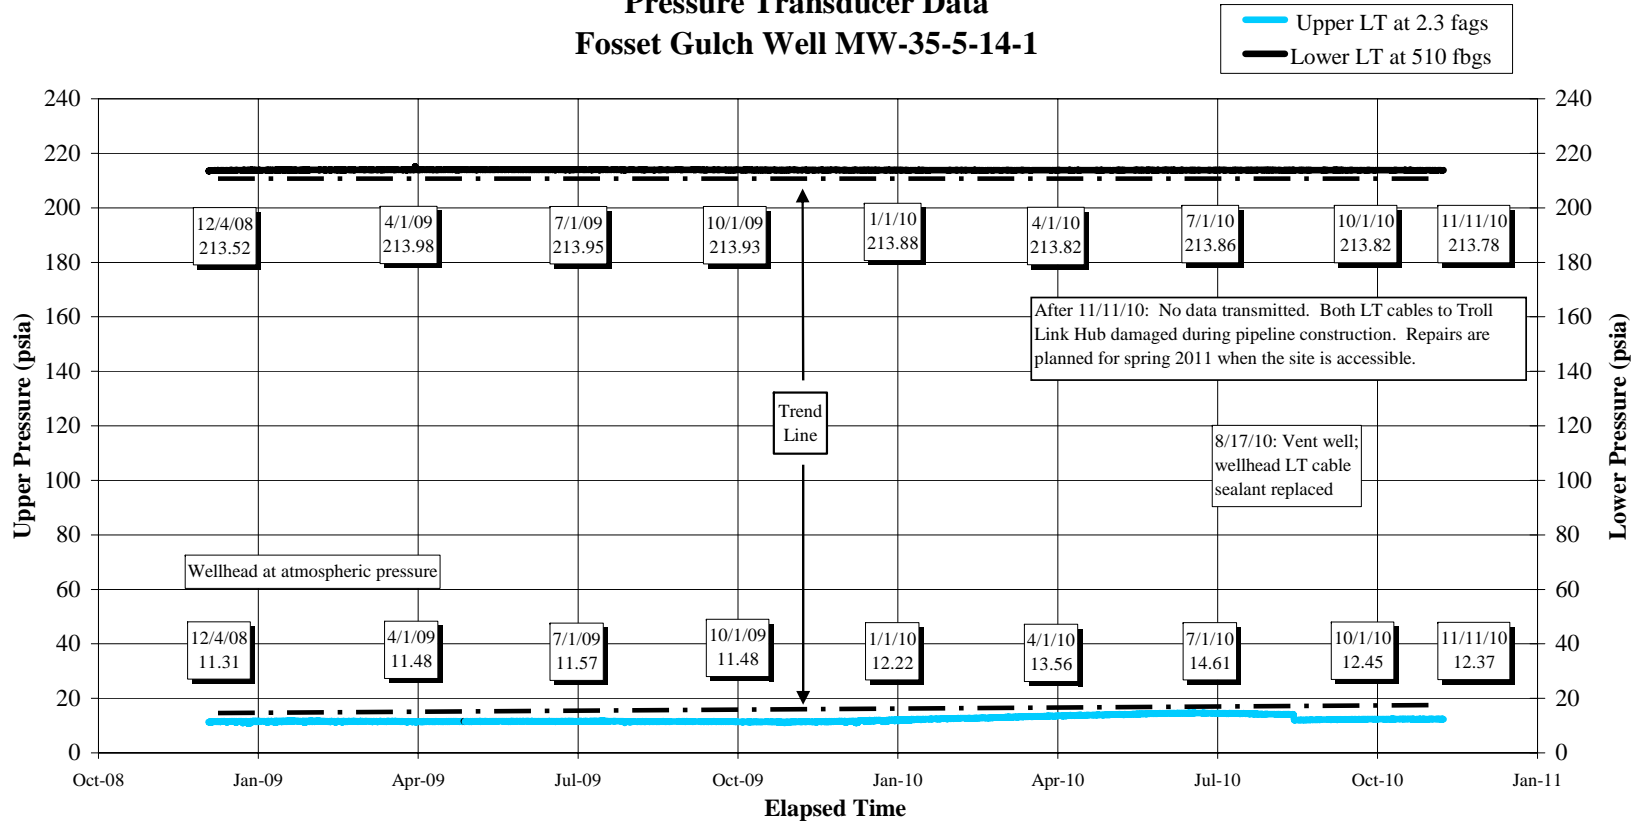

Table 3-2
Well Pressure Data Summary for Fosset Gulch Monitoring Wells

Well ID and Transducers	Period of Record	Initial Shut In Well Pressure psia	Ending Shut In Well Pressure psia	Net Change in Well Pressure psi	Initial Water Level in Well fbgs	Ending Water Level in Well fbgs	Net Change in Water Level ft
MW 34-5-14-1 Upper	12/4/08 to 11/11/10	11.31	12.37	1.06	43.58	45.15	-1.57
Lower		213.52	213.78	0.26			
MW 34-5-14-2 Upper	7/23/08 to 11/11/10	17.04	14.51	-2.53	39.29	33.78	5.51
Lower		242.65	242.51	-0.14			

3.2.1 MW 34-5-14-1

Figure 3-3 charts the upper and lower pressure transducer data and the calculated water level in the well. Table 3-2 and Figure 3-3 show the wellhead pressure at atmospheric pressure prior to 2010 followed by a gradual increase in pressure through August 16, 2010 (14.19 psia). Following the August 17, 2010 well maintenance event, the wellhead pressure remained constant at about 12.5 psia through November 11, 2010. Figure 3-3 also shows a flat down-hole pressure curve (213.5-213.9 psia) for the entire period of record. Figure 3-3 also shows a flat water level curve (42 fbgs and 43.5 fbgs) until November 2009, followed by a gradually declining water level trend through July 1, 2010 (50.13 fbgs); and water level rise to 49.28 fbgs until the well was vented on August 17, 2010. The water level immediately rose to 44.36 fbgs when the well was vented on August 17, 2010, then gradually declined to 45.15 fbgs on November 11, 2010.

**Figure 3-3
Pressure Transducer Data
Fosset Gulch Well MW-35-5-14-1**

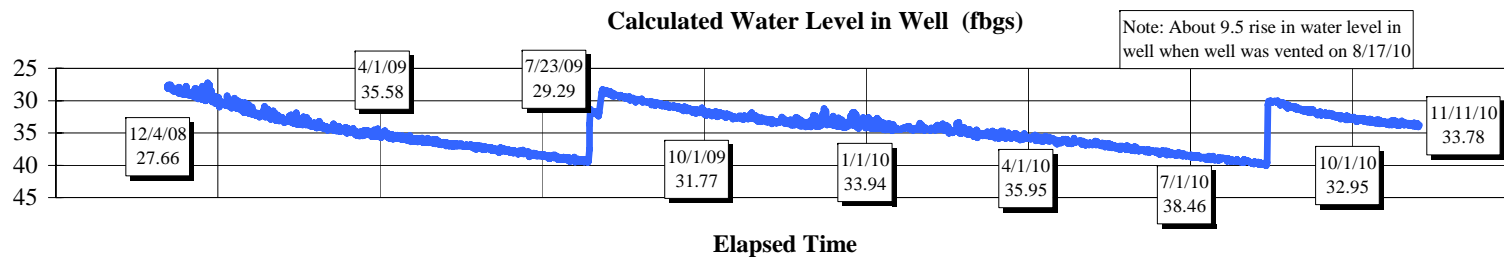

3.2.2 MW 34-5-14-2

Figure 3-4 charts the upper and lower pressure transducer data and the calculated water level in the well. Although the well was shut in for monitoring on December 4, 2008, wellhead pressure did not stabilize at about 17 psia until July 2009. Table 3-2 and Figure 3-4 show a net decrease of about 2.5 psi in wellhead pressure for the period of record between July 23, 2009 (17.04 psia) and November 11, 2010 (14.51 psia). Figure 3-4 shows a flat down-hole well pressure curve for the entire period of record, with fluctuations ranging between a minimum pressure of 241 psia to a maximum pressure of 242.8 psia. The down-hole pressure was 242.51 psia on November 11, 2010.

Table 3-2 indicates a net water level rise of about 5.5 in the well as of November 11, 2010. However, Figure 3-4 shows that the wellhead pressure and water level on November 11, 2010 had yet to return to the same pressure regime exhibited prior to venting the well on July 23, 2009 and August 17, 2010. Although there is an immediate drop in wellhead pressure and corresponding rise in the water level each time the well is vented to the atmosphere, Figure 3-4 also shows the build up in wellhead pressure takes two to four months to return to the pressure regime exhibited prior to each well venting event. Continued monitoring without venting the well for at least six months is expected to be required to confirm undisturbed well pressure conditions.

**Figure 3-4
Pressure Transducer Data
Fosset Gulch Well MW-35-5-14-2**

3.3 HIGHWAY 151

Monitor wells MW 34-4-30-1 and MW 34-4-30-2 have been monitored since December 3, 2008. Initial and ending monitoring well pressures and calculated water levels in the wells for the period of record are summarized in Table 3-3. The lower Level Troll cable wellhead Conax gland seal fitting Teflon sealant was replaced with a Neoprene sealant after both wells were vented on June 2, 2010.

Table 3-3
Well Pressure Data Summary for Highway 151 Monitoring Wells

Well ID and Transducers	Period of Record	Initial Shut In Well Pressure psia	Ending Shut In Well Pressure psia	Net Change in Well Pressure psi	Initial Water Level in Well fbgs	Ending Water Level in Well fbgs	Net Change in Water Level ft
MW 34-4-30-1 Upper	12/3/08 to 1/1/11	11.56	11.87	Atmospheric Pressure	35.54	30.49	5.05
Lower		104.43	106.98	2.55			
MW 34-4-30-2 Upper	12/3/08 to 1/1/11	13.18	18.04	4.86	41.65	51.39	-9.74
Lower		129.59	130.09	0.50			

3.3.1 MW 34-4-30-1

Figure 3-5 charts the upper and lower pressure transducer data and the calculated water level in the well. Table 3-3 and Figure 3-5 show a relatively stable well pressure regime with a flat wellhead pressure curve at atmospheric pressure, a flat down-hole pressure curve at about 106-107 psia, and a flat water level curve at 30- 33 fbgs since August 2009. Spike fluctuations in both wellhead pressure and the water level shown on Figure 3-3 correspond to the immediate loss of pressure when the well is vented (e.g., June 2, 2010), followed by a gradual return to the well pressure regime exhibited prior to venting the well.

Pressure Transducer Data
Highway 151 Well MW-34-4-30-1**

Calculated Water Level in Well (fags)

3.3.2 MW 34-4-30-2

Figure 3-6 charts the upper and lower pressure transducer data and the calculated water level in the well. Table 3-3 and Figure 3-6 shows a flat down-hole pressure curve with a mere 0.5 psi change from 129.59 psia on December 3, 2008 to 130.09 psia on January 1, 2011. In addition, there was a net wellhead pressure increase of about 4.9 psi with a corresponding net decline of nearly 10 ft in the water level for the entire period of record from December 3, 2008 (13.18 psia) to January 1, 2011 (18.04 psia).

Figure 3-6 also shows that a wellhead pressure trend ranging between 16 and 18 psia and a corresponding water level trend ranging between 47 fbgs and 52 fbgs may be the norm under complete shut in conditions. Similar to the Well 34-4-30-1 pressure regime for the period record, spike fluctuations in both wellhead pressure and the water level correspond to the immediate loss of pressure when the well is vented (e.g., June 2, 2010), followed by a gradual return to the well pressure regime exhibited prior to venting the well.

3.4 DEEP CANYON

Monitor well MW 34-4-32-1 has been monitored since June 2, 2010. Initial and ending well pressures and calculated water levels in the monitor well are summarized in Table 3-4 for the indicated period of record.

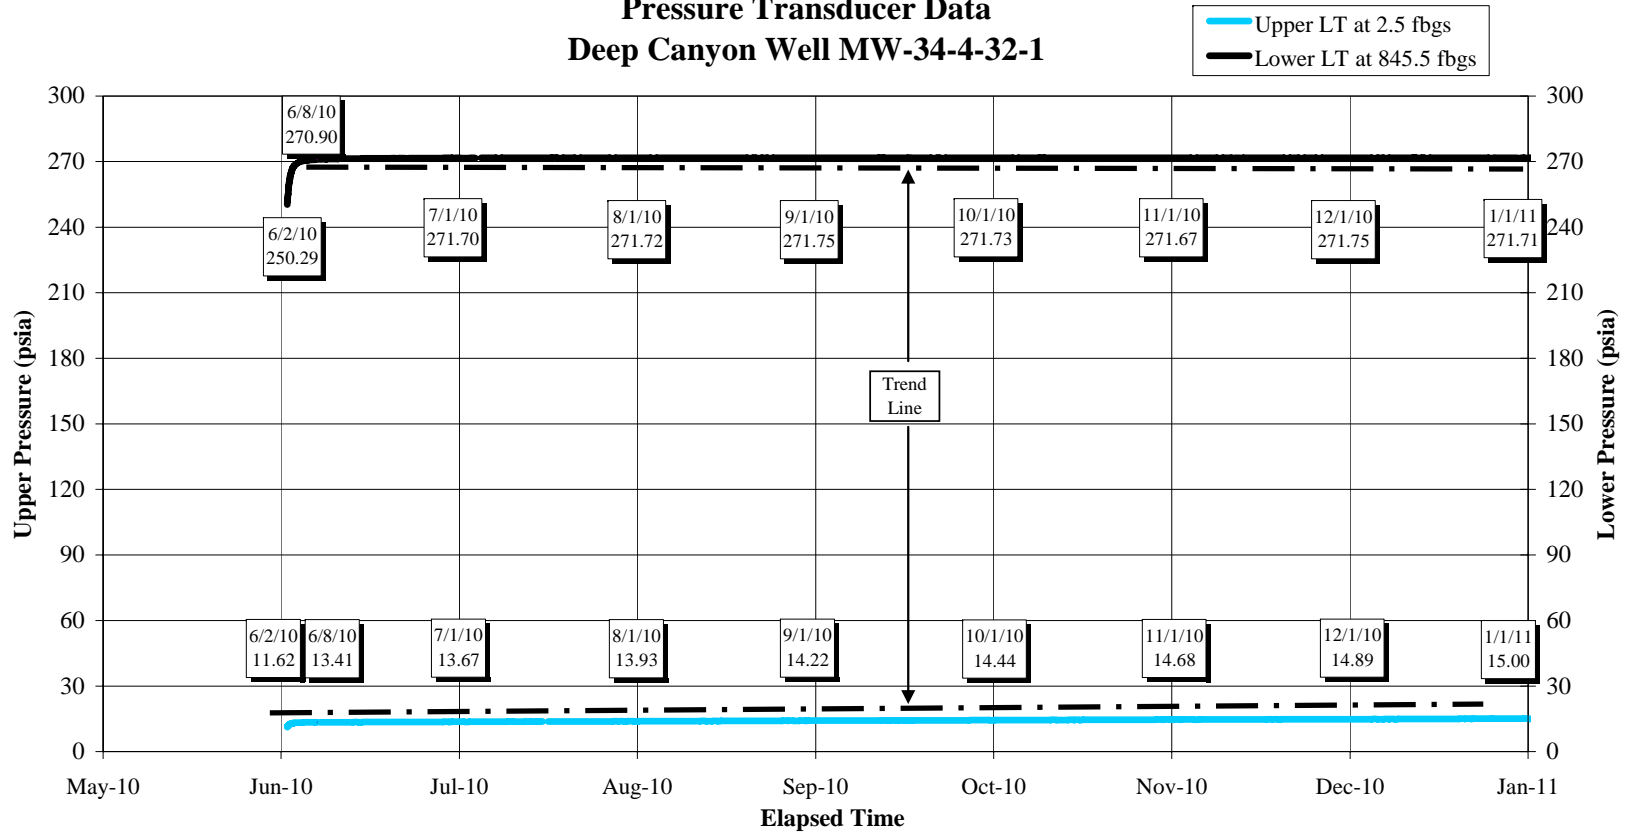

Table 3-4
Well Pressure Data Summary for Deep Canyon Monitoring Well

Well ID and Transducers	Period of Record	Initial Shut In Well Pressure psia	Ending Shut In Well Pressure psia	Net Change in Well Pressure psi	Initial Water Level in Well fbgs	Ending Water Level in Well fbgs	Net Change in Water Level ft
MW 34-4-32-1 Upper	6/8/10 to 1/1/11	13.41	15.00	1.59	251.21	253.01	-1.8
Lower		270.9	271.71	0.81			

3.4.1 MW 34-4-32-1

Figure 3-7 charts the upper and lower pressure transducer data and the calculated water level in the well. Table 3-4 and Figure 3-7 show the well pressure initially stabilized on June 8, 2010, six days after the well was shut in for monitoring on June 2, 2010. Prior to shut in on June 2, 2010, Figure 3-7 shows the wellhead pressure at 11.62 psia (atmospheric pressure), down-hole pressure at 250.29 psia, and water level in the well at about 294 fbgs. By June 8, 2010, wellhead pressure had increased 1.8 psi to 13.41 psia, bottom-hole pressure had increased 20.4 psi to 270.7 psia, and the water level in the well had risen about 43 ft to 252.21 fbgs. Table 3-4 and Figure 3-7 also show a relatively stable well pressure regime for the 7-month period of record through January 1, 2011 with only a slight increase in well pressure and a corresponding water level decline of 1.8 feet in the well.

4.0 FUTURE WORK

Future routine work will consist of periodic field checks of each monitoring system and remote retrieval of recorded pressure measurement data using the In-Situ Inc. TROLL[®] Link telemetry system and ISI Data Center. COGCC staff will schedule an inspection and testing of all wellhead components and instruments after the 2011 spring snowmelt period when all monitoring well sites are safely accessible.

APPENDIX A
4M PROJECT MONITOR WELL CHRONOLOGY

4M Project Monitor Well Chronology

Location	Well	2010				
		May	Jun	Aug	Sept	Nov
Basin Creek	MW 34-9-7-1	May 18: Well Inspection		Aug 18: Vented well; Replaced all wellhead LT cable Conax Teflon gland seals with Neoprene seals		
	MW 34-9-7-2					
Palmer Ranch	MW-35-8-19-1	May 18: Not able to inspect well due to reclamation	Jun 3: Vented well; Replaced both wellhead LT cable Conax Teflon gland seals with Neoprene seals			
Fiddler	MW-35-8-10-1	May 18: Well Inspection	Jun 3: Vented well; Replaced both wellhead LT cable Conax Teflon gland seals with Neoprene seals; TROLL® Link cables checked/connections cleaned			
South Fork Texas Creek	MW 35-7-8-1	May 18: Well Inspection; Tightened small leak on upper LT Conax fitting		Aug 18: Vented well; Replaced both wellhead LT cable Conax Teflon gland seals with Neoprene seals; Lower LT raised from 390 fbgs to 374 fbgs due to cable damage		
	MW 35-7-8-2	May 18: Well Inspection; Tightened small leak on upper LT Conax fitting and ball plug; Ball plug fitting leak on lower LT	Jun 14-24: Well spliced into gas mitigation system Jun 25: Gas mitigation system actively drawing gas from well	Aug 6: Well shut in from gas mitigation system Aug 18: Vented well; Replaced both wellhead LT cable Conax Teflon gland seals with Neoprene seals		
BP Highlands	MW-34-7-15-1	May 18: Not able to inspect well due to reclamation	Jun 3: Vented well; Replaced both wellhead LT cable Conax Teflon gland seals with Neoprene seals			
Beaver Creek Ranch	MW 35-6-17-1	May 18: Well Inspection; Tightened small leak on upper and lower LT cable Conax fitting		Aug 18: Vented well; Replaced all wellhead LT cable Conax Teflon gland seals with Neoprene seals		
	MW 35-6-17-2	May 18: Well Inspection; Tightened hissing leak on upper LT cable Conax fitting; Small leak at fitting into flange				
Shamrock Mines	MW 35-6-13-1	May 18: Well Inspection; No leaks; Tightened upper and lower LT cable Conax fitting	Jun 2: Vented well; Replaced both wellhead LT cable Conax Teflon gland seals with Neoprene seals Jun 3: Upper LT raised to ground level after removal of 4 ft of damaged cable			
Wagon Gulch	MW-34-4-30-1	May 18: Well Inspection; No leaks; Solar power instrument pool-cable conduit sealed		Aug 17: Vented well; Replaced lower LT wellhead cable Conax Teflon gland seal with Neoprene seal		
	MW-34-4-30-2			Aug 17: Vented well; Replaced lower LT wellhead cable Conax Teflon gland seal with Neoprene seal; Upper LT external mount changed to down-hole mount 2.5 fbgs		
Fosset Gulch	MW-35-5-14-1	May 18: Well Inspection; No leaks		Aug 17: Vented well; Replaced both lower LT wellhead cable Conax Teflon gland seals with Neoprene seals		Nov 11: Telemetry sys off-line; cable damage during pipeline construction
	MW-35-5-14-2					
Highway 151	MW-34-4-30-1	May 18: Well Inspection; No leaks	Jun 2: Vented well; Replaced both lower LT wellhead cable Conax Teflon gland seals with Neoprene seals			
	MW-34-4-30-2					
Deep Canyon	MW-34-4-32-1	May 18: Well installed	Jun 2: Installed Level Troll data logger equipment & telemetry system
